Handsfree Reference Repositories

Curated open-source components, libraries, and foundational code to accelerate your hackathon development.

Tracky Mouse

https://github.com/1j01/tracky-mouse

A robust JavaScript-based head-tracking library. It features advanced 2D point tracking blended with 3D head tilt, dwell-clicking, and facial gesture modifiers (like blinking or opening the mouth to click).

Best for: Web-based computer vision math and facial gesture logic.

CursorViaCam

https://github.com/Deepender25/CursorViaCam

A Python/MediaPipe implementation featuring adaptive speed (moving the head fast jumps across the screen; moving slow allows fine precision) and button sticking to help users land on small targets.

Best for: Smoothing algorithms and dynamic pointer acceleration.

Handsfree-for-website

https://github.com/sljavi/handsfree-for-website

A JavaScript package that adds voice control directly to web DOM elements. It handles mapping commands like "scroll up" or "click" to actual browser actions effortlessly.

Best for: DOM interaction logic and voice command routing.

Picovoice Browser Extension

https://github.com/Picovoice/browser-extension

A proof-of-concept for running wake-word detection and voice AI entirely on-device within a Chrome extension using WebAssembly, ensuring maximum privacy and offline availability.

Best for: Privacy-first, offline voice recognition and wake-word logic.
